TITLE: Electric conductivity of zinc oxide thin films during chemisorption and photolysis of ammonia

SOURCE: Zhurnal fizicheskoy khimii, v. 41, no. 1, 1967, 3-7

TOPIC TAGS: zinc oxide, chemisorption, ammonia, photolysis, electric conductivity

ABSTRACT: The electric conductivity of zinc oxide (a typical n-type semiconductor) was studied during chemisorption of ammonia at low pressures (up to 1 mm Hg) on ZnO samples which were first heated in a vacuum at 350°C. Upon introduction of NH₃ into the vessel containing ZnO, the electric conductivity of the latter decreased (at 20-300°C). This indicates that the NH₃ molecule adsorbed on the ZnO surface is an acceptor of electrons, which are the current carriers. The dependence of stationary values of the electric conductivity of ZnO on the NH₃ pressure at 20 and 250°C was determined. The dependence of the electric conductivity kinetics on the temperature and pressure was studied, and the apparent activation energy of the electric conductivity of ZnO during adsorption on NH₃ was found to be ~1.4 kcal/mole. A change in

ACC NR: AP7006233

the conductivity of ZnO under conditions of photolysis of ammonia and of the mixture NH₃ + Ne was observed; this change is due to the adsorption of H atoms and NH₂ radicals on ZnO. Orig. art. has: 4 figures and 3 formulas.

TITLE:

New Technique in the Projects of Giprosteklo (Novaya tekhnika v proyektakh Giprosteklo).

PERIODICAL: Steklo i Keramika., 1957,¹⁴ Nr 12, pp. 1- 6 (USSR)

ABSTRACT: The technical equipment of the glass works was considerably increased. In 1948-1957 a thorough reorganization of the pyrometric aggregates of the glass works for sheet glass was carried out, in adapting the same to a direct feeding of the machines with glass mass from the melting furnace. For the first time this was carried out in 1948, in the glass works of Gusevskiy imeni Dzerzhinskiy and afterwards subsequently in the others whereby for the heating of the furnaces section regenerators were used. The new furnace basins are planned with a width of 8 m and equipped with an automatic control and regulating system. By this the daily output of the furnaces was increased from 70-90 tons to 120 - 150 tons which did not necessitate the construction of new glass works for the time being. The institute Giprosteklo worked out typical schemes of the mechanization of work of the machines, whereby mechanisms of the P K B glass institute were used. In table 1 the old and newly planned works are compared to one another. The project worked out by the institute of works for poli-

72-12-1/14

shed glass on the basis of the assembly line - WC - 500 was carried out in the Gusevskiy glass works imeni Dzerzhinskiy and in 1953 put in operation. The design of the assembly line WC - 500 as well as WC - 1000 was worked out by the collective of the G S P K B under the leadership of V. I. Chemm and A. I. Yelizarov (reference 1). The new department Sh P S is destined for the treatment of sheet glass with the measurements 1,6 x 2,4 m. The project of the works Saratov for technical glass is based on the assembly line WC - 1000 whereby it was adapted from a cyclical working regime to a continuous one, the measurements of the sheet glass were increased up to 3 x 4,5 m. In current year the institute Giprosteklo has worked out the project of a still greater factory for polished glass for the Bashkirian Republic (figure 1 and 2) in which a simultaneous bilateral treatment of a continuous glass band of a width of 3 m is provided as well as a gas-electric heating of the furnaces and an almost complete automatization of all working processes. The provided output amounts to 3 million tons of polished glass, 6 million m² of window glass etc. In the works "Proletariy" a project of the reform of the department Sh P S was worked out (figure 3) which provides an increase of the output of cut glass of from 100,000 to 800,000 m². The effectiveness of the projects of the Giprosteklo is shown in table 2. It is provided to adapt the Gor'kiy glass works to panoramic glass (panoramnoye

Card 2/3

steklo). In 1947 a project for the adaption of the works of Krasnatinovskiy "Avtosteklo" was worked out under the leadership of I. I. Kitaygorodskiy and a plant for the sintering of foam glass (perosteklo) was constructed. The institute also planned and carried out an automatic experimental plant for foam glass (AYT-1) (figure 4) in the glass works of Gomel. The technical-economic values of this plant are given in table 3. In table 4 the technical and economic values of 3 new projects are given (Ivotsk, Moscow, and Saratov). Further projects for the new production of glass tubes and glass tare for the medical industry were worked out as well as great works carried out for the gasification of the glass works. Furthermore electric and gas-electric melting furnaces are planned in order to increase the specific efficiency as well as the quality of the glass. There are 5 figures, 4 tables,

TITLE: The Choice of an Expedient Design for a Plant Producing Foam Glass

PERIODICAL: Steklo i keramika, 1959, Nr 12, pp 15 - 21 (USSR)

ABSTRACT: The Soviet method of producing foam glass from powders elaborated by the Kafedra stekla MKhTI imeni Mendeleyeva (Chair of Glass, MKhTI imeni Mendeleyev) found world-wide appreciation. At present, the Gomel'skiy stekol'nyy zavod (Gomel' Works) produces foam glass in the shape of blocks of various sizes in accordance with the above method. In the Institut stekla (Institute of Glass) experiments were made with the manufacture of special parts of foam glass for the insulation of pipelines. In the USSR the production of foam glass develops slowly, a fact explained by the great production cost. The authors of the present paper, however, refuted this assumption on the basis of data supplied by the Konstantinovskiy zavod "Avtosteklo" (Konstantinovka Works "Avtosteklo"), the Ivotskiy zavod (Ivot Works) and the Gomel'skiy zavod (Gomel' Works) et al. ✓

Card 1/3

The Choice of an Expedient Design for a Plant Producing SCV/72-59-12-6/19
Foam Glass

In the course of the past ten years a number of various plants were designed, constructed and tested by Soviet engineers. The displacing possibilities of molds in the furnace are shown in figures 1-5. Since 1952 experiments have been made in the USSR concerning the production of foam glass as a continuous band without molds. In 1957-1958 an automatic experimental plant AUP-1 was tested in the Gomel' Works the design of which was worked out in the Giprosteklo upon suggestions by the authors' collective L. M. Butt, M. I. Steshenko, V. L. Gaysinskiy, V. A. Il'inskiy, K. A. Myasnikov, I. S. Blagoobrazov, and L. S. Koleshko. A scheme is given in figure 6. Experiments with the above plant were made by the Gomel' Works, Giprosteklo, the Institute of Glass and its Proyektno-konstruktorskoye byuro (Planning and Design Bureau) (see Ref 1). The temperature curve of the furnace is plotted in figure 7. At present the Giprosteklo is working out the AUP-2 automatic plant. In figure 8 the scheme of a conveyer belt appliance is given which has been elaborated by I. I. Kitaygorodskiy, B.I.Borisov, L. M. Butt, and M. I. Kokon'. The Proyektno-konstruktorskoye byuro Instituta stekla (Planning and Design Bureau of the Glass

Card 2/3

The Choice of an Expedient Design for a Plant Producing SOV/72-59-12-6/19
Foam Glass

Institute) is working out an assembly based on the foam glass formation on heat-proof steel conveyer belt. The productiveness of the establishment of departments and works for the production of foam glass may be seen from the table. In conclusion the authors consider plants producing foam glass without molds in the shape of a continuous band as the most perfect and prospective ones since they permit the automation of production processes. Until a typical industrial conveyer belt plant will be created it is recommended to build continuous type furnaces for the production of foam glass, which have stood the test. There are 8 figures and 1 table.

EXCERPTA MEDICA Sec. 6 Vol. 11/8 Aug. 57
MYASNIKOV

1967. MYASNIKOV L.A. Hosp. Therap. Clin., 2nd Med. Inst., Moscow. The influence of various neurotropic substances on the cholesterolaemia of arteriosclerotic patients (Russian text) KLIN. MED. (Mosk.) 1956, 6 (65-69) Illus. 4

A study was made of the influence of a number of neurotropic substances on cholesterolaemia. The blood level of free cholesterol and also of cholesterol ester was measured in 96 patients both before and after doses of the following drugs: amytal nitrate (0.3 g.), chloral nitrate (1.0 g.), phenamine (0.92 g.), and caffeine (0.3 g.). Amytal nitrate and chloral hydrate lowered the total blood cholesterol level by 25-33 mg./100 ml., whereas phenamine and caffeine raised it on the average by 25 mg./100 ml. It follows therefore that substances depressing the activity of the CNS lower the blood cholesterol level and that stimulants of the CNS raise the level. The level of cholesterol ester remained constant. The experimental results indicate the role of a nervous factor in the regulation of the blood lipid level.

Penetration of metals by supersonic waves. L. L. M. A. Mooney. *Leslie Metallurgie*, 15, No. 1, 23 (1936). *Z. Angew. Chem.* **1936**, **1**, 3573. The method proposed depends upon the fact that supersonic waves, which readily penetrate homogeneous metals, upon emerging from the metal produce a cyclic pattern on the oil-air interface created by coating the metal with translucent oil. If there is inhomogeneity in the metal - rocks, flakes, etc., then such flaws, which are impervious to the supersonic waves, can be detected by the presence of smooth areas on the oil film. The app used is described and its application discussed. M. G. Moore

✓ The half-widths of the absorption microradiowave lines of ammonia A. A. Kolosov and L. L. Myasnikov. Optika i Spektroskopiya 1, 374-7 (1959). The effect of pressure on the half-widths of the lines in the microradiowave absorption spectrum of NH_3 was determined in the range $2-3 \times 10^5$ cycles/sec. and $10^{-1}-10^{-1}$ mm. pressure. It was found that the half-width of the absorption line increases with increasing intensity which is in accord with the theoretical predictions. A study of the hyperfine structure of the absorption lines showed that the change in the half-width of the satellites is of the same order of magnitude as that of the principal line; this agrees with the theory.

Title : Investigation of the Half-width of the Microwave
Absorption Lines of Ammonia

Orig Pub : Optika i spektroskopiya, 1956, Vol 1, No 3, 374-377

Abstract : The inversion spectrum of ammonia in the region $2 \cdot 10^{10}$ - $3 \cdot 10^{10}$ cycles has been investigated. The effective collision diameters and the pressure dependence of the half-width of the line λ in the region 10^{-1} - 10^{-3} mm/Hg have determined for the states $J, K = 1, 1; 9, 8; 3, 3;$ and $4, 4$. For $p = 10^{-1} - 10^{-2}$ mm/Hg, λ varies in accordance with the empirical formula $\lambda = 28p(288/T) \sqrt{K^2/J(J+1)}^{1/3}$ (B. Blaney and R.P. Penrose, Phys. Soc., 1948, 60, 540). At lower p agreement is impaired, apparently due to the Doppler effect. A decrease in λ was observed with decreasing intensity of the lines.

TITLE: Results of the Observations of the Solar Eclipses of 1952 and 1954 at
a Wavelength of 3.2 cm

PERIODICAL: V sb.: Polnyye solnechn. zatmeniya 25 fevr. 1952 g. i 30 iyunya 1954 g.
Moscow, AN SSSR, 1958, pp 331 - 332

ABSTRACT: The authors give the results of the radio observations of the solar
eclipses of 25 Feb. 1952 and 30 June 1954. The residual intensities
of the sun's radio emission amount to < 4% and 0.98% respectively.

TITLE: The Stabilization of the Frequency of the Quartz Generator by Means of a Spectral Line (3,3) N¹⁴H₃, (Stabilizatsiya chastoty kvartaewogo generatorda posredstvom spektral'noy linii (3,3)N¹⁴H₃)

PERIODICAL: Vestnik Leningradskogo Universiteta, Seriya fiziki i khimii, 1958, Vol. 10 Nr 2, pp. 38-42 (USSR)

ABSTRACT: In the present paper the method worked out by the authors for the stabilization of the frequency of a quartz generator by means of the microwave of absorption in gaseous ammonia is described. In order to stabilize the quartz generator the microabsorption line N¹⁴H₃ (3-3) at a pressure of 10⁻² mm mercury column was chosen. The application of gaseous ammonia is justified by the fact that the line (3-3) is well known and is easily accessible within the radiofrequency range. Besides, it is of high intensity and can therefore easily be observed in the small absorbing gas cells. Thanks to the exterior fields, the displacement of the spectral line is quite insignificant at normal conditions, and the insta-

Card 1/3

Generator by Means of a Spectral Line (3,3) N¹⁴H₃

54-10-2-4/16

bility of the order of 10^{-10} caused by it can be disregarded. Modern methods make it possible to obtain great stability of the shape of the line. For the purpose of stabilization a scheme of the automatic adjustment of the frequency of the quartz generator was used (fig. 1). The following factors influence the operational stability of the scheme: 1.) Stability of the shape of the line. 2.) Stability of the amplification coefficients of the amplifiers. 3.) Starting stability of the multivibrators. 4.) Modification of the shape of the modulating signal. 5.) Modification of the feed voltage. The stability of the shape of the line depends on the pressure in the gas cell (table 1). As already mentioned, the stability of the amplification coefficients of the amplifiers influences the operation of the scheme. If anode feed is modified by 10% a shift of 1 microsecond occurs, which corresponds to a deterioration of relative instability of up to $3 \cdot 10^{-7}$. The change of the shape of the line also manifests itself in the accuracy of operation of the system. If the frequency of the absorption line is more towards the end of the sinusoid, the line will change with respect to time. It was found by calculation that the most favorable point of operation is near the turning point of the sinusoid and that the permitted displacement is within the limits

Card 2/3

The Stabilization of the Frequency of the Quartz
Generator by Means of a Spectral Line (3,3) N¹⁴H₃

54-10-2-4/16

of $\pm 5^\circ$. In practice possible displacement was found to be greater, and deviations from the order $\pm 30^\circ$ are permitted. This may be explained by the fact that the modulating signal slightly differs from the sinusoid and has a longer linear part. In the case of a linear displacement by more than the half distance from the center, the recordings of the phase detector are modified by 0.2 V. There are 8 figures, and 1 table.

SOV/141-2-3-7/26

TITLE: Methods in Atom-beam RadiospectroscopyPERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiofizika,
1959, Vol 2, Nr 3, pp 384 - 387 (USSR)

ABSTRACT: The basic instrument is that of Figure 1. Atoms emitted by the source π pass through sections A and B in which non-uniform magnetic fields sort out the atoms according to the sign of the effective dipole moment. Between A and B there is a section C with a uniform magnetic field, at the beginning and the end of which there are resonators E_1 and E_2 , excited by a high-frequency source. Particles which traverse the entire system are collected by an ionization detector D. The whole assembly is evacuated. Figure 2 shows the passage of a beam through the system when the non-uniform fields are similarly oriented and the moments are directed into alternative states. The method is analogous to the optical one using a Foucault knife-edge and is similarly explicable in terms of refractive indices.

Card 1/3 Correct operation requires the resonators tuned and excited

at the Larmor frequency. According to semi-classical theory an atom traversing a field system of the kind described has associated with it a directed wavelength depending on the velocity and frequency of effective dipole moment reorientation. This wavelength may be used to explain the mechanism whereby the moment is "tipped-over" into the alternative state. Roughly speaking, at E_1 and E_2 , phase-shifts of $\pi/2$ are introduced. This corresponds to the Ramsey condition (Refs 1,2). The effective width of the resonance line is derived from the indeterminacy condition and is approximately equal to $1/2t_\alpha$, where t_α is the flight-time of an atom. In this method of spectroscopy the intensity distribution has an interference character, the widths of the bands depending on the flight-time between resonators. The expression, Eq (2), for the width of a "maximum" practically coincides with another of Ramsey's formulae. Careful adjustment of the resonators alters the shape of the

AUTHOR: Myasnikov, L. L.

TITLE: Acoustic Spin Resonance in Metals

PERIODICAL: Akusticheskiy zhurnal, 1960, Vol. 6, No. 3, pp. 347

TEXT: The present paper deals with theoretical problems of acoustic magnetic resonance in metals. Acoustic nuclear magnetic resonance occurs when the ultrasonic frequency is equal to or a multiple of ω_0 . Absorption of phonons having energies of $\hbar\omega_0$ or $n\hbar\omega_0$ disturbs the thermal equilibrium between the nuclear spins and the metal lattice and equalizes the occupation of the levels. The interaction between ultrasonic waves and atomic nucleus is considered to be a quadrupole interaction. The reestablishment of thermal equilibrium depends on the interaction between conduction electrons and local magnetic field. Acoustic magnetic resonance may be theoretically studied with the help of a semiclassical set of equations interrelating the occupation of the magnetic levels and the necessity of a relaxation mechanism. Such a study is described in Ref. for another problem. The author makes use of part of the calculations Card 1/2

given in Ref. 1. However, he proceeds from the quantum-mechanical point of view, and not from semiclassical equations. This way was found to lead to the same equations. There are only few data available on acoustic resonance in metals. For experimental purposes, the author recommends a combination of electromagnetic and acoustic excitations of nuclear resonance. There are 2 references 1 Soviet

ORG: Leningrad Ship-Building Institute (Leningradskiy korabestroitel'nyy institut)TITLE: Detecting atom beams used in frequency standard and radio spectroscopes

SOURCE: IVUZ. Radiofizika, v. 9, no. 1, 1966, 72-80

TOPIC TAGS: frequency standard, radio spectroscope

ABSTRACT: An investigation is reported of the surface ionization of K, Rb, Cs atom beams by texturized W and Pt, and Ta atom beam by Pt and W oxide. The method and equipment of the investigation follow those of N. Ramsey ("Molecular Beams"), R. F. Minturn et al., J. Appl. Phys., v. 31, 876, 1960, and N. Simpson "Instruments for Scientific Investigations". A 10^{-7} -torr vacuum was maintained during the experiments. Plots of ionic current of K, Rb, Cs vs. ionizer temperature, thermionic emission vs. collector potential, Ta beam current vs. emitter temperature, ion-current transient time vs. emitter temperature, and W-oxide ion current vs. operation time at a constant emitter temperature are presented. The ionization coefficient (1.6%) of an electron-bombardment detector is much lower than that (90%) of a surface-ionization detector; however, the latter has the advantage of being practically inertialess. Maximum estimated ionization effective cross-sections are:

AUTHOR: Mvasnikov, L.E.; Raygorodskiy, L.D.; Finagin, B.A.

TITLE: Investigation of the reflection of potassium, rubidium and cesium atomic beams from a quartz plate

SOURCE: Zhurnal tekhnicheskoy fiziki, v.35, no.3, 1965, 542-545

TOPIC TAGS: atom, potassium rubidium, cesium, reflection, diffraction, quartz crystal, ultrasonic vibration

ABSTRACT: The authors have investigated the reflection of K, Rb and Cs atoms from the polished surface of an X-cut quartz crystal. The atomic beams were formed in a constant temperature oven containing the alkali metal in the liquid state and provided with a collimating channel (dimensions not given), and the reflected atoms were detected by surface ionization on a tungsten strip. The attitudes of the oven and detector relative to the quartz reflecting surface could be changed without breaking the vacuum. The quartz crystal could be heated, cooled or excited to mechanical vibration at the resonant frequency of 980 kc/sec. The most efficient specular reflection (reflection coefficient from 15 to 20%) was obtained at a graz-

Card 1/2

L 40945-65

ACCESSION NR: AP5007305

ing angle of 3°. When the quartz reflector was heated from room temperature to 340°K the reflected beam became considerably more diffuse. When the reflector was cooled to 230°K, two diffraction maxima appeared (with the K and Rb but not the Cs beams) at reflection grazing angles of approximately 9°. These diffraction maxima disappeared and the reflected beam became slightly more diffuse when the quartz reflector was excited to ultrasonic vibration (amplitude 0.4 micron). Calculations of the diffraction by a two-dimensional grating representing the quartz crystal surface of atoms having de Broglie wavelengths corresponding to the 400°K oven temperature gave results that were not in agreement with the observed positions of the diffraction maxima. It is suggested that diffraction by the surface layer at small grazing angles may represent a case intermediate between Bragg scattering and diffraction by a two-dimensional grating. TOPIC TAGS: aluminum alloy, magnetoacoustic effect, acoustic absorption, torsional vibration, acoustic resonance, solid solution, grain structure			
ABSTRACT: To check on the hitherto uninvestigated increase of the phase velocity and increase of absorption of torsional sound waves in alloys, the authors prepared aluminum alloys with different contents of iron impurity - of the order of tenths and hundredths of one per cent. Plates of equal dimensions were tested (130 x 7.5 x 2 mm), fastened precisely at the vibration node, tuned to odd harmonics, and excited by resonance with torsional oscillations from X-cut Rochelle salt crystals. The resonance curve was plotted by producing beats from two sound generators with a constant frequency difference of 50 cps. When a constant magnetic field was applied, the resonant frequency was different from that without a field. The relative change of phase velocity was determined from the change in the resonant frequency, and the damping of the torsional oscillations was estimated from the relative logarithmic decrement of the oscillation with and without the field. The results show that the magnetoacoustic effect depends on the grain dimensions, density, chemical composition, and other fac-

SHIPBUILDING ENGINEERING

PURPOSE AND COVERAGE: This book is intended to acquaint technicians and scientists in the shipbuilding industry with the foundations of modern electronics and their application aboard ship. The author emphasizes problems of quantum electronics; he has tried to make the book accessible to general readers with a knowledge of mathematics, physics, and radio engineering within the scope of the curriculum of shipbuilding schools. The author regrets that he devoted too little space to the practical application of quantum electronics aboard ship. G. P. Drukarév, A. S. Ter-Pogasyan and B. A. Finagin read the manuscript and provided valuable comments and advice. There are 91 references: 35 Soviet and 56 non-Soviet.

Title : Modulation Method of Measuring Small Electric Voltages in the
Audio Frequency Range.

Orig Pub: Acust. Zh., 1956, 2, No 3, 248-254

Abstract: Description of the application of the modulation method for the measurement of small voltages in the audio frequency range. The modulation is effected by means of periodic variations of a capacitor. An approximate method is indicated for calculating the input circuit of the circuit and the parameters of the modulators, and suitable nomograms for the purpose are given. A counter-phase circuit for connecting two modulators is proposed and yields simultaneously large values of modulation coefficients and voltage transfer coefficients. The method developed permits measurements against a background that exceeds considerably the intrinsic noise of the measuring portion

Sponsoring Agency: Glavnaya upravleniya gidrometeorologicheskoy sluzhby pri Sovete Ministrov SSSR.

Rep. Ed.: V.A. Ur'yazev; Ed.: V.S. Protopopov; Tech. Ed.: N.I. Bragina.

PURPOSE: This work is intended for meteorologists, hydrologists, and hydrophysicists, particularly those engaged in the study of snow and ice and evaporation processes.

COVERAGE: This book contains papers on hydrophysics which were presented and discussed at the Third All-Union Hydrological Conference in Leningrad, October 1957. The Conference published 10 volumes on various aspects of hydrology of which this is number 3. The editorial board in charge of the series includes V.A. Ur'yazev (Chairman), O.A. Alechin, Ye. V. Bilyanuk (deceased), O.M. Borisek, M.A. Vasil'yanov, I.K. Daryarov, A.P. Domantat'skiy, G.P. Kalinin, S.M. Kritskiy, B.I. Kudelin, L.P. Manoil', B.P. Orlin, I.V. Popov, A.K. Proskuryakov, D.L. Sokolovskiy, O.A. Spesivtsev, A.I. Chubarov, and S.K. Cherkashev. This volume is divided into 2 sections: the first contains reports from the subsections for the study of evaporation processes, and the second contains reports from the snow and ice subsection. References accompany each article.
